Setting up data collection

Analyzing crashes

AppMetrica doesn't conflict with other libraries that collect and process app crashes. If you use such libraries, initialize A libraries.

AppMetrica SDK saves the crash report to a file and sends them the next time it is run.

The library does not symbolicate or deobfuscate app crashes. These operations are performed on the server o

To upload mapping files to AppMetrica, use the AppMetrica Gradle Plugin. It automatically uploads the mappin app. For more information, see uploading mapping files and debugging symbols on Android.

For automatically collecting information about app crashes, AppMetrica uses the standard handler Thread.UncaughtExc crash handler directly inside the app, use the following example of implementing correct data handling:

Kotlin **Java**

```
val previousUncaughtExceptionHandler = Thread.getDefaultUncaughtExceptionHandler()
// Creating a new handler.
val uncaughtExceptionHandler = Thread.UncaughtExceptionHandler { thread, exception ->
    try {
        // Put your logic here.
    } finally {
        // Sending a message about an app crash to the system handler.
        previousUncaughtExceptionHandler?.uncaughtException(thread, exception)
    }
}
// Setting the default handler.
Thread.setDefaultUncaughtExceptionHandler(uncaughtExceptionHandler)
```

This way you handle the exception yourself, then pass it on, and AppMetrica can send information about it.

If you want to transmit additional information about an app crash, use this example up to initializing the library in the app
